

REDACTSTRIPE

Secure Redaction Controlled Release

A secure, role-based platform for preparing sensitive records for authorized release from intake and redaction through review, approval, and export.

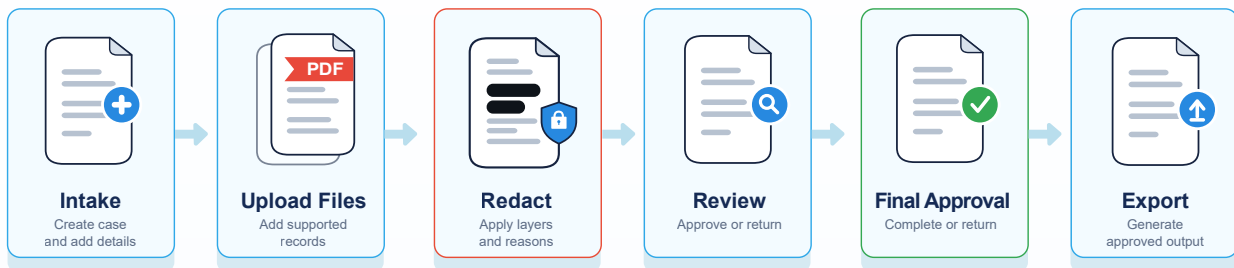

FOIA • PUBLIC RECORDS • PRIVACY • LEGAL • COMPLIANCE

HOW IT WORKS

From Intake to Authorized Release

RedactStripe guides records through a controlled sequence from intake to release, so every handoff between roles stays visible, auditable, and easy to track.

1

Create the Case

FOIA Officer enters request details, priority, deadline, and team.

2

Add Files

Source documents are uploaded and confirmed available.

3

Redact

Redactor applies redactions, assigns layers and reasons, and saves.

4

Submit for Review

Completed work moves into the configured review path.

5

Review & Approve

Reviewer checks quality; Manager makes the final decision.

6

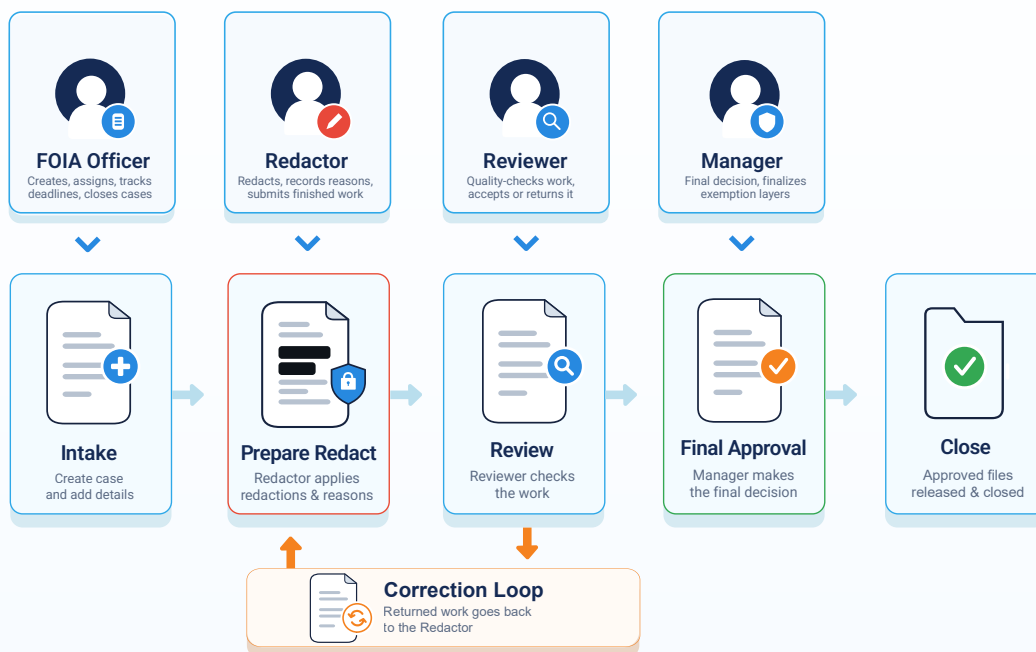

Export & Close

Approved output is released; the FOIA Officer closes the case.

ROLES & RESPONSIBILITIES

Roles and Working Relationships

RedactStripe uses role-based access so each person sees the work and actions relevant to their responsibility

● The usual working flow:

FOIA Officer creates and assigns the case; the Redactor prepares the files; the Reviewer checks the work when one is assigned; and the Manager makes the final decision.

Reviewer-optional cases:

A case may be configured without a Reviewer. In that situation, submitted work moves directly to the Manager's final-review stage.

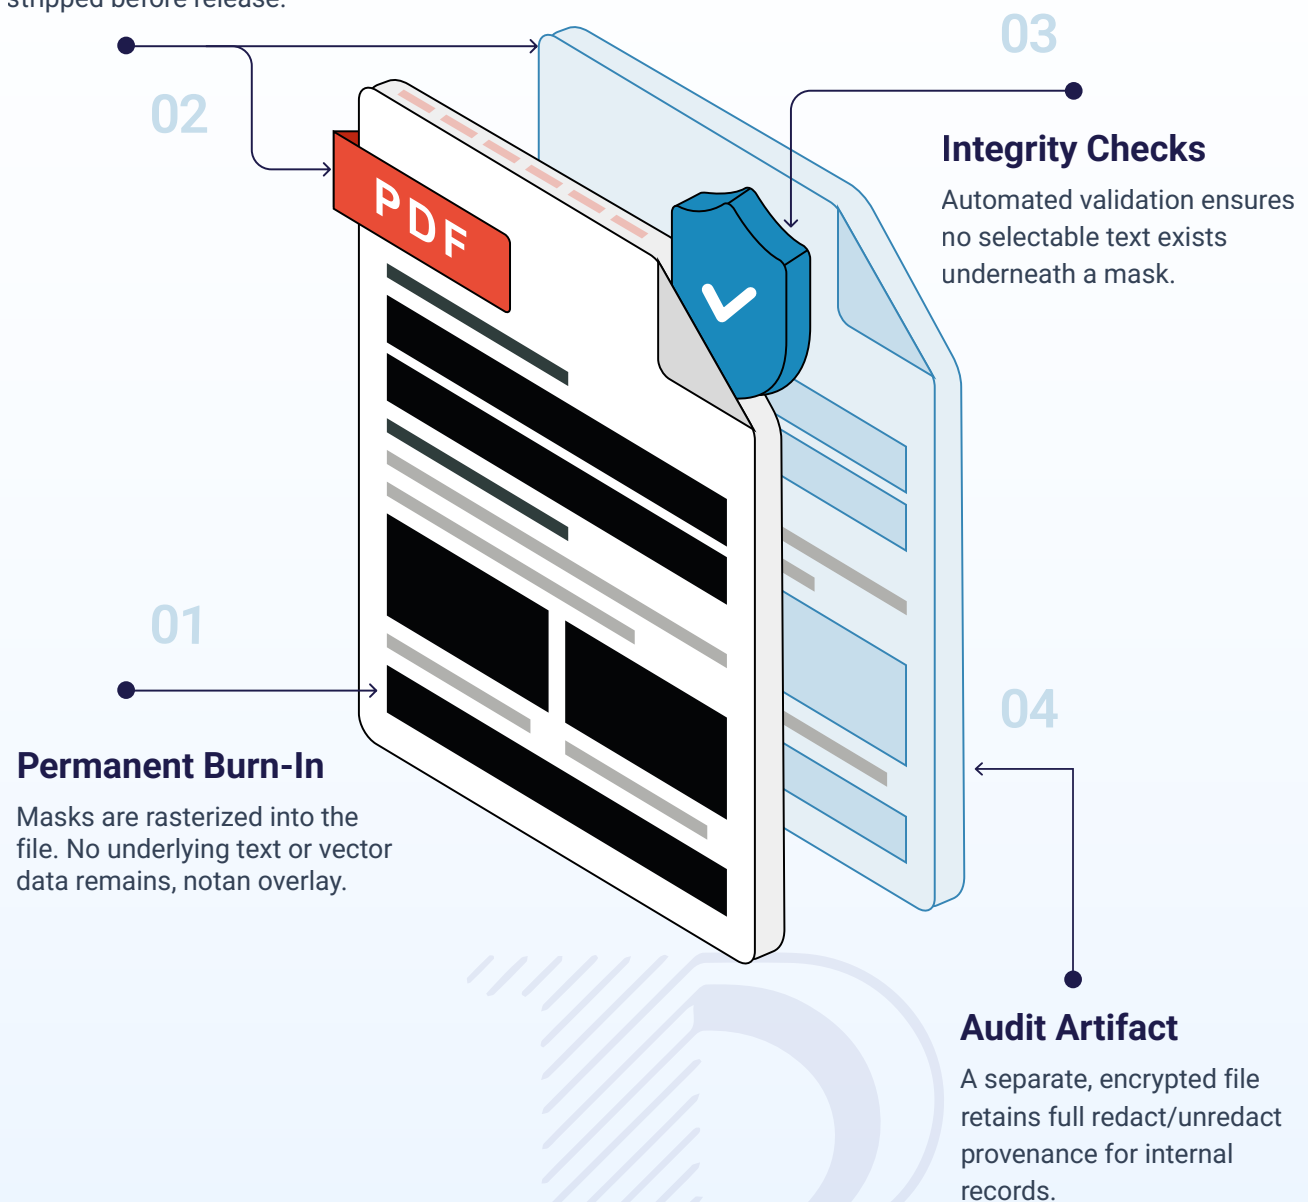

COLLABORATION & TRANSPARENCY

Work Better Together

Every redaction is permanently burned in, sanitized of hidden metadata, and validated for integrity, with a separate audit artifact preserving full redact history.

Sanitization

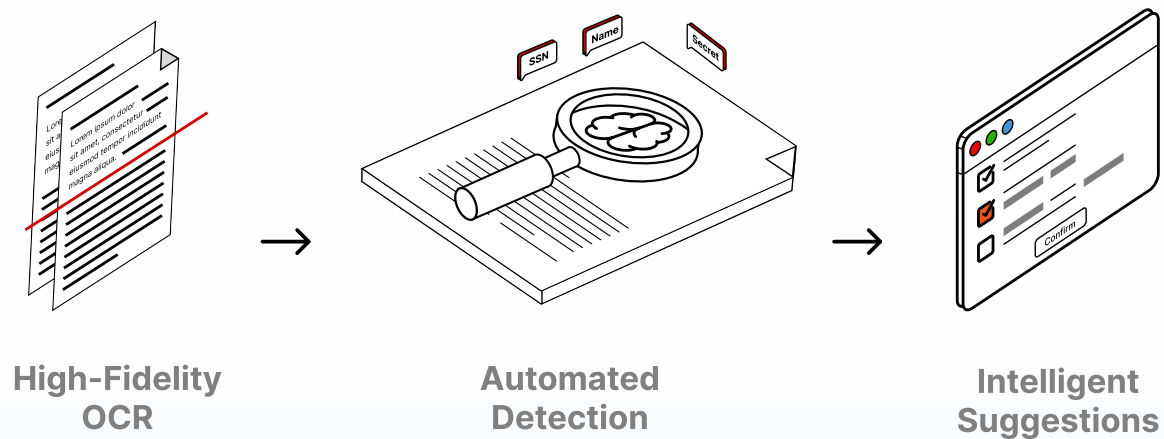

Metadata, hidden properties, and revision history are stripped before release.

SECURE DOCUMENT MANAGEMENT

Enterprise-Grade Protection

High-fidelity OCR retains layout coordinates while automated detection identifies PII, PHI, and classified indicators for confidence-scored suggestions.

1

High-Fidelity OCR

Retains original layout coordinates so nothing shifts out of place.

2

Automated Detection

Identifies PII, PHI, and classified indicators across the record.

3

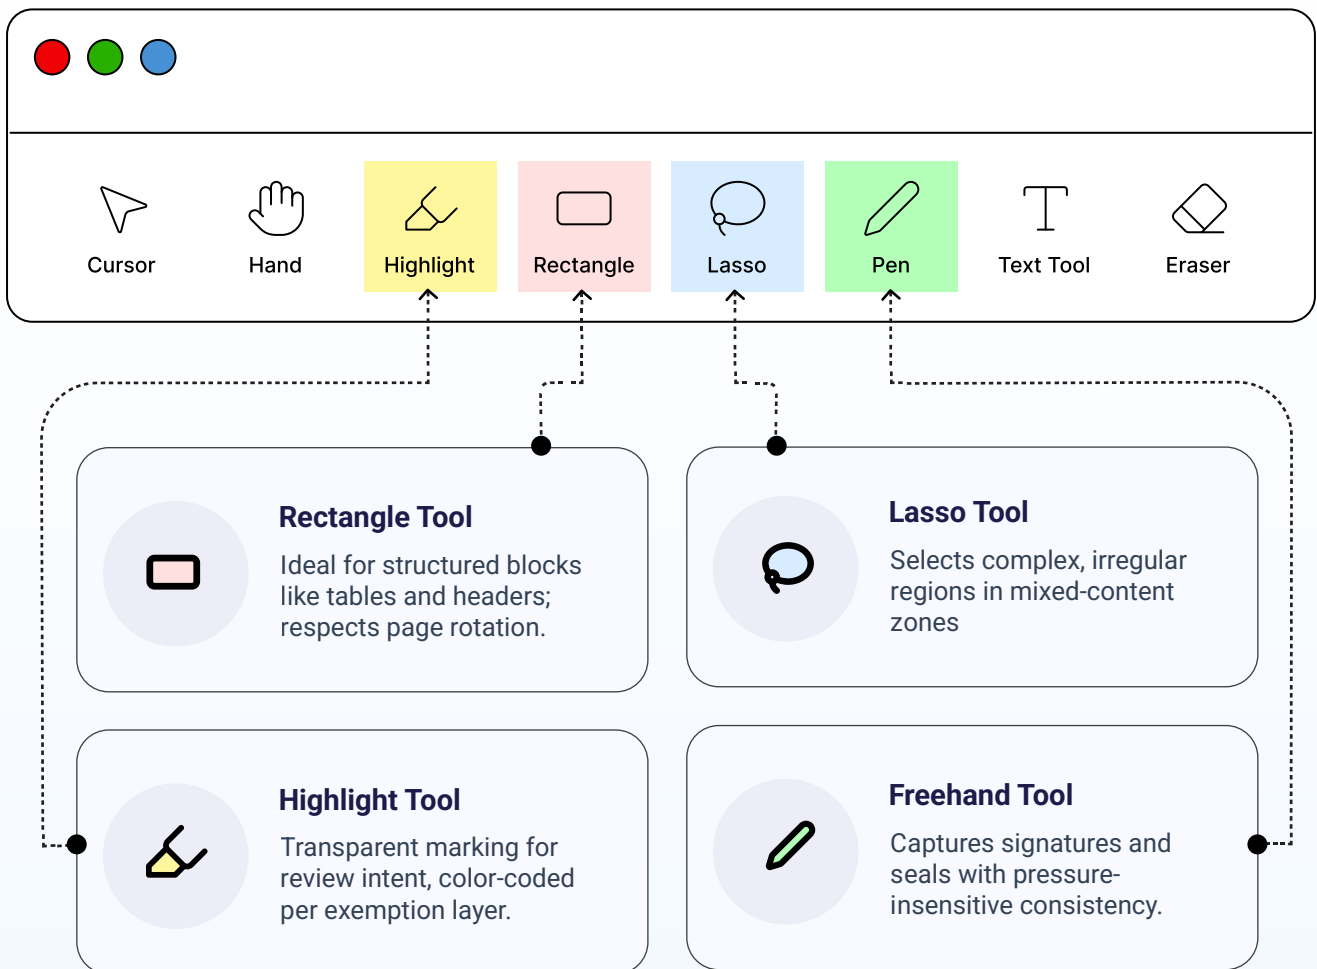

Intelligent Suggestions

Proposes redactions based on confidence scoring; users confirm before applying.

REDACTION TOOLS

Efficiency Meets Compliance

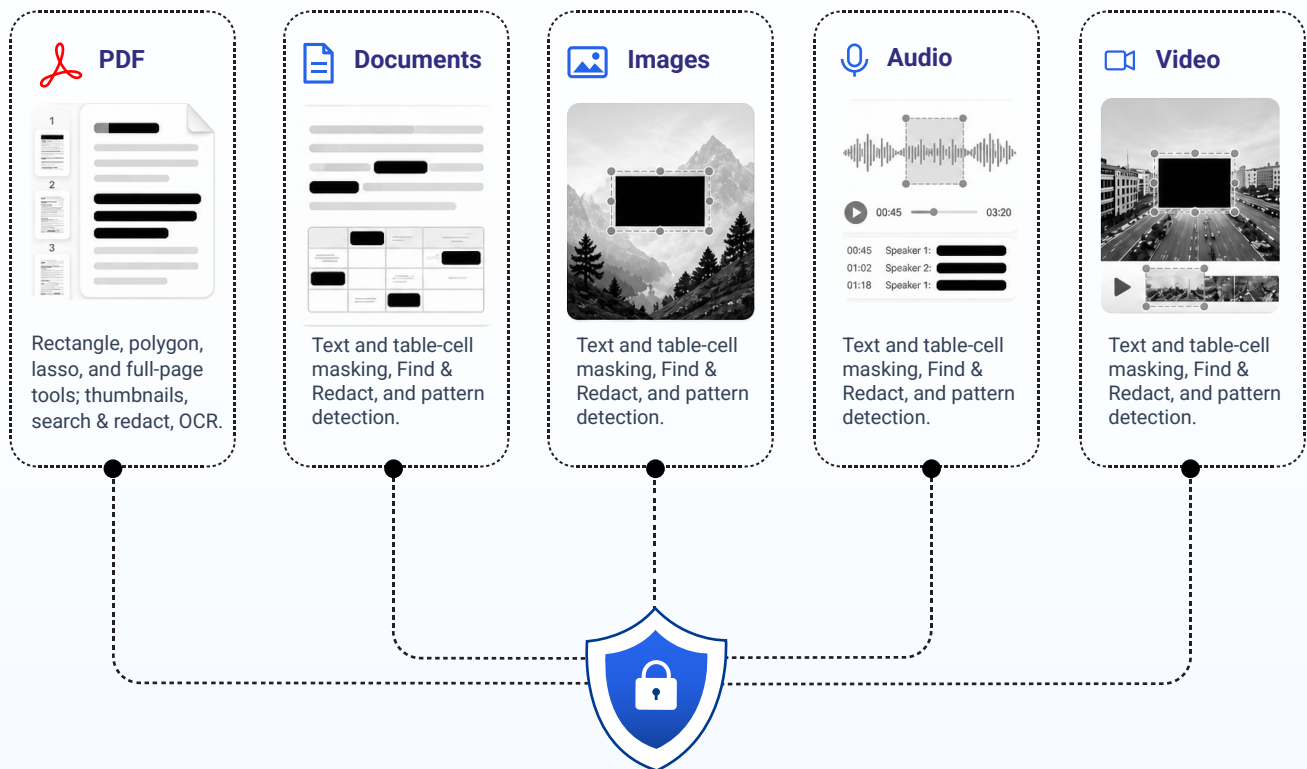

Highlight, rectangle, lasso, and freehand tools cover every kind of sensitive content, from structured tables and headers to irregular signatures, seals, and photographs.

BY FILE TYPE

One Workspace, Every Format

RedactStripe provides file-specific controls so users can work naturally with PDF, Word, image, audio, and video records, using the same save, reason, and submit pattern.

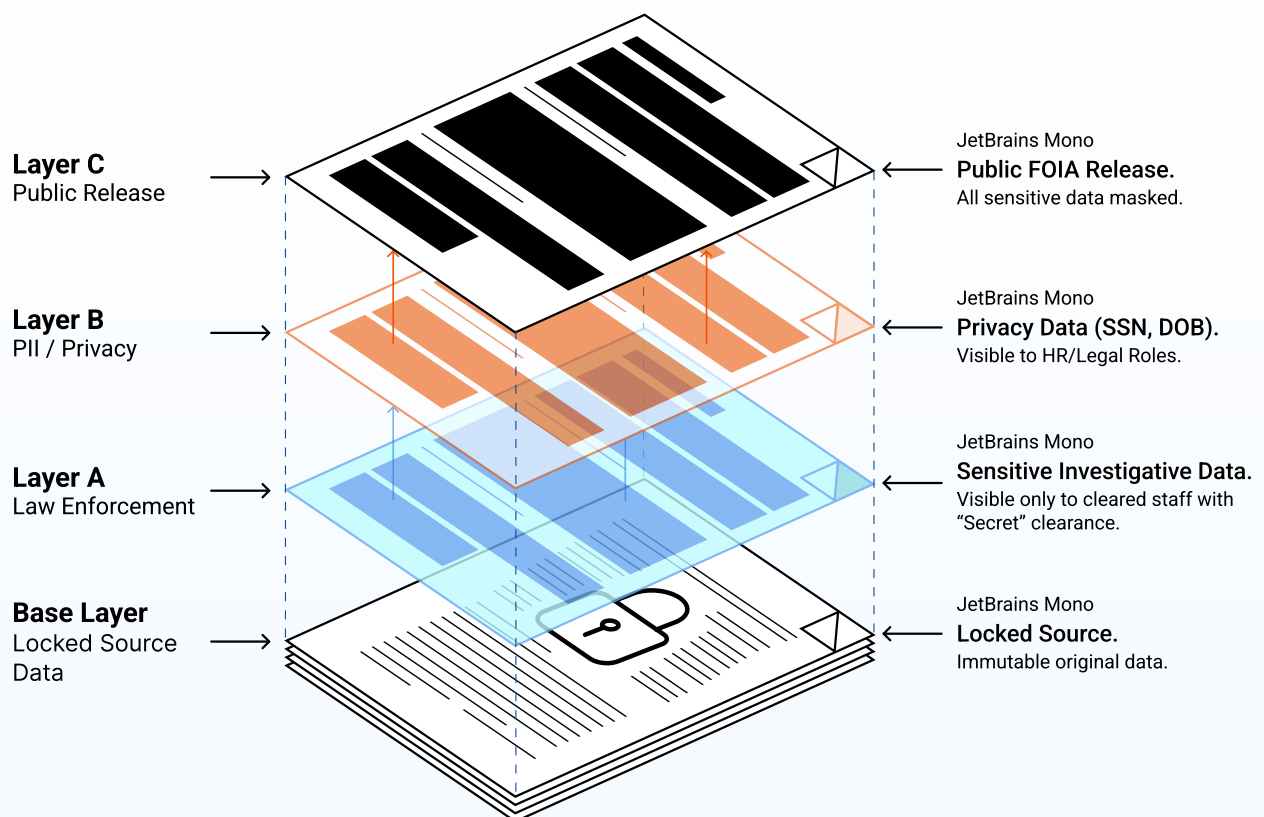

**Different formats.
One Consistent redaction workflow.**

EXEMPTION LAYERS

Every Redaction Has a Reason

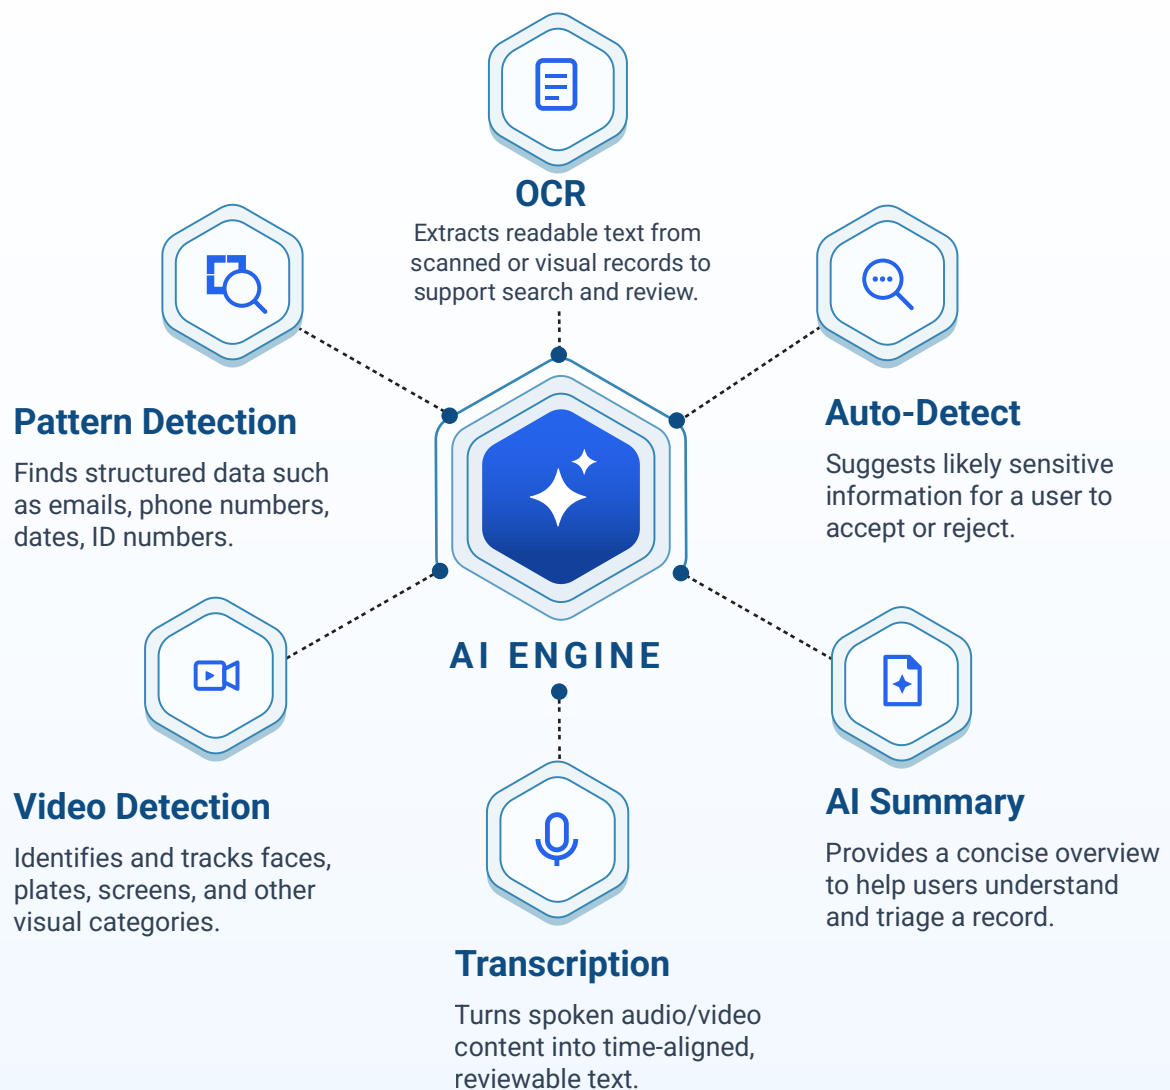

Layers connect each redaction to the legal or policy basis for withholding information, and Managers may lock a finalized layer to prevent further changes.

AI-ASSISTED, HUMAN-DECIDED

Automation That Knows Its Place

RedactStripe combines automation with human review to reduce repetitive work across every file type. Suggested redactions are reviewed and confirmed before submission.

HUMAN REVIEW

Authorized users review context, accept, modify, or reject suggestions.

DASHBOARDS & ANALYTICS

See the Work, See the Risk

Dashboards present the information most relevant to each role, while analytics help teams understand volume, quality, workload, and overall workflow performance.

SECURITY & COMPLIANCE

Built for Trust, Ready When You Are

Personal settings and organization-wide safeguards help protect sensitive records, supported by role-based access, multi-factor authentication, and full session oversight.

REDACTSTRIPE

From Sensitive Records to Authorized Release

Redact sensitive information with precision while maintaining complete control across every stage of review. Ensure every record is securely protected, confidently approved, and ready for authorized release.
